Super Charged Structured Water Whole Home Vortexer (Quad Flow)

INSTALL GUIDE

For Support Call 208-462-0626

INSTALLATION INFORMATION:

The Quad Flow is designed to sit on the floor and should be installed where the water supply line enters the home. It is best to install so both irrigation and home water are treated by the Quad Flow.

- 1.The Quad Flow is bi-directional. Water can flow either way through the unit.
- 2.Designed only for cold water use.
- 3.There are no filters to change or maintenance for the Quad Flow.
- 4.The Quad Flow features two refillable ceramic mineral ball water enhancement chambers. These cartridges should be changed yearly and are available from our web store.
5. Please note, these devices are handcrafted and there may be slight alterations.

(Typical installation for the Quad Flow using stainless steel flex connector hoses. The stainless steel multi-round filter housing is installed inline with the Quad Flow.)

Flex Connector Hoses

Stainless steel flex connector hoses are included with your Quad Flow unit and are required for attaching to the water supply. These hoses contain gaskets allowing for an easy seal. Tighten by hand plus 1/4 turn with wrench. Be careful not to cross thread or over tighten fittings when connecting flex hoses to the Quad Flow unit.

Using rigid, immovable inlet/outlet water supply lines for the Quad Flow will void the warranty. The inlet and outlet lines need to be flexible to avoid excessive stress on the PVC fittings causing them to crack over time..
